

Math 432 Implementation Homework 4

Due date: 10 May Sunday

You can get help from AI but write down your own code

1. (15 points) Implement the Berlekamp Massey Algorithm for binary sequences. Your code gets the binary sequence part with arbitrary length and outputs the characteristic polynomial of the smallest LFSR producing the input sequence.
2. (15 points) Implement the RC-4 algorithm. Your code gets key and arbitrary length plaintext for input and produces the ciphertext for output in the encryption direction and produces the plaintext from the ciphertext in the decryption direction.
